

Variations in Nature

All natural elements found in nature may vary due to things such as exposure to solar radiation, temperature changes, weather, hydraulic forces, time, earthquakes and tectonic/volcanic activity to mention a few. These natural variations have an effect on California Earth Minerals products. Clay mined from our mine site location in Southern California started in 1946 and continues today. We may mine one lot a few yards over one way or the other or perhaps deeper from time to time. The deeper strata of our colloidal calcium montmorillonite clays predates modern man and at those depths we eliminate manmade contaminants in our clays that are intended for human applications.

As a result of different mining locations throughout our vast deposit, some of these natural variations result in different taste, smell, texture and even color. This is similar to fruit from the same tree and even the same branch tasting different. Man can and does control factory made products to be consistent; however, there are usually other negatives to be concerned about such as negative side effects, toxicity, price, etc.

We at California Earth Minerals offer the very best premium edible colloidal clay on planet earth. Our clay products have been on the market since the 1940's and the many health benefits of our clays are time proven. Mother Nature's products may not always be consistent, but we can usually benefit from them in many ways.

If our clay in powder form (Terramin) is troublesome using plain water, (a small price for good health), we offer tablets and natural chunks as an alternative. Another possibility is to simply blend the clay powder in a smoothie or try mixing with fruit or vegetable juice to make more enjoyable.

In the picture above, you can see the clay wall at our mine. Notice the way that the clay was deposited in layers over the thousands of millennia!
